

# Package: plantecowrap (via r-universe)

October 25, 2024

**Type** Package

**Title** Enhancing Capabilities of 'plantecophys'

**Date** 2020-04-02

**Version** 1.0.5

**Maintainer** Joseph Stinziano <josephstinziano@gmail.com>

**Description** Provides wrapping functions to add to capabilities to 'plantecophys' (Duursma, 2015, <doi:10.1371/journal.pone.0143346>). Key added capabilities include temperature responses of mesophyll conductance (gm, gmeso), apparent Michaelis-Menten constant for rubisco carboxylation in air (Km, Kcair), and photorespiratory CO2 compensation point (GammaStar) for fitting A-Ci or A-Cc curves for C3 plants (for temperature responses of gm, Km, & GammaStar, see Bernacchi et al., 2002, <doi:10.1104/pp.008250>; for theory on fitting A-Ci or A-Cc curves, see Farquhar et al., 1980; <doi:10.1007/BF00386231>, von Caemmerer, 2000, ISBN:064306379X; Ethier & Livingston, 2004 <doi:10.1111/j.1365-3040.2004.01140.x>; and Gu et al., 2010, <doi:10.1111/j.1365-3040.2010.02192.x>). Includes the ability to fit the Arrhenius and modified Arrhenius temperature response functions (see Medlyn et al., 2002, <doi:10.1046/j.1365-3040.2002.00891.x>) for maximum rubisco carboxylation rates (Vcmax) and maximum electron transport rates (Jmax) (see Farquhar et al., 1980; <doi:10.1007/BF00386231>).

acisummary	<i>Extracts coefficients from fitacis2</i>
------------	--

---

## Description

Extracts coefficients from fitacis2

## Usage

```
acisummary(data, group1, group2 = NA, group3 = NA, fits)
```

## Arguments

data	data frame with A/Ci curve data
group1	grouping variable 1, must match fitacis2
group2	grouping variable 2, must match fitacis2
group3	grouping variable 3, must match fitacis2
fits	list output from fitacis2

**Value**

acisummary produces a data frame with A-Ci coefficients. If the input data have failed curve fits, these need to be removed before running acisummary().

**Examples**

```
#Read in data
data <- read.csv(system.file("extdata", "example_2.csv",
package = "plantecowrap"), stringsAsFactors = FALSE)
#Run ACi curve fitting
fits <- fitacis2(data, group1 = "Grouping",
varnames = list(ALEAF = "A",
                Tleaf = "Tleaf",
                Ci = "Ci",
                PPFDF = "PPFD",
                Rd = "Rd",
                Press = "Press"),
fitmethod = "bilinear", fitTPU = TRUE, Tcorrect = FALSE)
#Extract coefficients
outputs <- acisummary(data, group1 = "Grouping", fits = fits)
```

---

 arrhenius

*The Arrhenius temperature response equation*

---

**Description**

The Arrhenius temperature response equation

**Usage**

```
arrhenius(Ea, Tleaf)
```

**Arguments**

Ea	activation energy in kJ mol <sup>-1</sup>
Tleaf	leaf temperature in Celsius

**Value**

arrhenius is an exponential temperature response model. This function automatically converts temperature from Celsius to Kelvin for the calculation. REFERENCE Arrhenius S. 1915. Quantitative laws in biological chemistry. Bell.

fitacis2

*Fit A-Ci curves with custom kinetics***Description**

Fit A-Ci curves with custom kinetics

**Usage**

```

fitacis2(
  data,
  group1,
  group2 = NA,
  group3 = NA,
  gm25 = 0.08701,
  Egm = 47.65,
  K25 = 718.4,
  Ek = 65.50828,
  Gstar25 = 42.75,
  Egamma = 37.83,
  fitmethod = "default",
  fitTPU = TRUE,
  Tcorrect = FALSE,
  useRd = FALSE,
  citransition = NULL,
  alphag = 0,
  PPFDF = NULL,
  Tleaf = NULL,
  alpha = 0.24,
  theta = 0.85,
  varnames = list(ALEAF = "Photo", Tleaf = "Tleaf", Ci = "Ci", PPFDF = "PARi", Rd = "Rd",
    Press = "Press"),
  ...
)

```

**Arguments**

data	data frame with A/Ci curves. Requires net CO <sub>2</sub> assimilation (Anet/Photo/ALEAF in $\mu\text{mol m}^{-2} \text{s}^{-1}$ ), leaf temperature (Tleaf in Celsius), intercellular CO <sub>2</sub> concentration (Ci, in $\mu\text{mol mol}^{-1}$ ), incident irradiance on the leaf (PPFD/PARi in $\mu\text{mol m}^{-2} \text{s}^{-1}$ ), atmospheric pressure (Patm/Press in kPa), and (optional, set useRd = TRUE for this option) respiration (Rd, in $\mu\text{mol m}^{-2} \text{s}^{-1}$ ).
group1	grouping variable 1, could be species, temperature, ID
group2	grouping variable 2
group3	grouping variable 3
gm25	mesophyll conductance at 25 Celsius in $\text{mol m}^{-2} \text{s}^{-1} \text{bar}^{-1}$

Egm	activation energy of mesophyll conductance in kJ mol <sup>-1</sup>
K25	Km in 21 in umol mol <sup>-1</sup> (equivalent to ubar bar <sup>-1</sup> )
Ek	activation energy of K <sub>air</sub> in kJ mol <sup>-1</sup>
Gstar25	photorespiratory CO <sub>2</sub> compensation point at 25 Celsius in umol mol <sup>-1</sup> (equivalent to ubar bar <sup>-1</sup> )
Egamma	activation energy of GammaStar in kJ mol <sup>-1</sup>
fitmethod	Set to either "bilinear" or "default". Default option in this package is "default". See ?fitaci in plantecophys for more details.
fitTPU	Should TPU limitations be fit? Set to TRUE/FALSE. See ?fitaci in plantecophys for more details.
Tcorrect	Should outputs be temperature corrected? Default here is FALSE. See ?fitaci in plantecophys for more details.
useRd	Should respiration be used? Default is FALSE. See ?fitaci in plantecophys for more details.
citransition	Pre-specify C <sub>i</sub> transition point? Units in umol mol <sup>-1</sup> (ubar bar <sup>-1</sup> ) Default is FALSE. See ?fitaci in plantecophys for more details.
alphag	Fraction of photorespiratory glycolate carbon that is not returned to the chloroplast (von Caemmerer, 2000). If A <sub>Ci</sub> curves show high-CO <sub>2</sub> decline, then this value should be > 0. See ?fitaci in plantecophys for more details.
PPFD	Light intensity? Can be retrieved from dataframe. Default is NULL. Units are umol m <sup>-2</sup> s <sup>-1</sup> . See ?fitaci in plantecophys for more details.
Tleaf	Leaf temperature? Can be retrieved from dataframe. Default is NULL. Units are Celsius. See ?fitaci in plantecophys for more details.
alpha	Quantum yield of electron transport. Default is 0.24. Units are umol electrons / umol incident photons. See ?fitaci in plantecophys for more details.
theta	Curvature of the photosynthetic light response. Default is 0.85. If light response has sharper transition, increase up to 1. If light response has shallower curves, decrease towards 0. See ?fitaci in plantecophys for more details.
varnames	Variable names in your dataframe. ALEAF is net CO <sub>2</sub> assimilation in umol m <sup>-2</sup> s <sup>-1</sup> , Tleaf is leaf temperature in Celsius, C <sub>i</sub> is intercellular CO <sub>2</sub> concentration in umol mol <sup>-1</sup> , PPFD is light intensity in umol m <sup>-2</sup> s <sup>-1</sup> , Rd is respiration rate in umol m <sup>-2</sup> s <sup>-1</sup> , and Press is atmospheric pressure in kPa. See ?fitaci in plantecophys for more details.
...	Further arguments for plantecophys::fitaci(). See ?fitaci for details.

### Value

fitacis2 allows gmeso, GammaStar, and Km to vary with Tleaf. Output matches the fitacis function from plantecophys. Note that the temperature response function of Km is derived from the temperature responses of K<sub>o</sub> and K<sub>c</sub> in Bernacchi et al.2001, as is the GammaStar temperature response defaults. The gm defaults are from Bernacchi et al. 2002 fitted between 1 and 35 Celsius. Also note that this ALWAYS uses gm. To fit data on a "C<sub>i</sub>-basis", set gm25 really high (e.g. 10000 mol m<sup>-2</sup> s<sup>-1</sup> bar<sup>-1</sup>) and Egm to 0 kJ mol<sup>-1</sup>.

In some instances (e.g. very low stomatal conductance), `fitacis2` will fail. In these cases, the output for that curve will be "Failed", rather than an A-Ci curve fit object.

CSIRO Publishing, Collingwood.

### Examples

```
#Read in data
data <- read.csv(system.file("extdata", "example_2.csv",
package = "plantecowrap"), stringsAsFactors = FALSE)
#Run ACi curve fitting
fits <- fitacis2(data, group1 = "Grouping",
varnames = list(ALEAF = "A",
                Tleaf = "Tleaf",
                Ci = "Ci",
                PPFDF = "PPFD",
                Rd = "Rd",
                Press = "Press"),
fitmethod = "bilinear", fitTPU = TRUE, Tcorrect = FALSE)
```

---

fit\_topt\_VJ

*Fitting the temperature responses of Vcmax and Jmax*

---

### Description

Fitting the temperature responses of Vcmax and Jmax

### Usage

```
fit_topt_VJ(
  data,
  varnames = list(Vcmax = "Vcmax", Jmax = "Jmax", Tleaf = "Tleaf"),
  title = NULL,
  limit_jmax = 1e+05,
  limit_vcmax = 1e+05,
  ...
)
```

### Arguments

`data` Dataframe containing Vcmax (maximum rubisco carboxylation capacity in  $\mu\text{mol m}^{-2} \text{s}^{-1}$ ), Jmax (maximum photosynthetic electron transport to CO<sub>2</sub> fixation in  $\mu\text{mol m}^{-2} \text{s}^{-1}$ ), and Tleaf (leaf temperature in Celsius)

varnames	Variable names to account for different spellings of Vcmax, Jmax, and Tleaf.
title	Graph title, usually a group name
limit_jmax	Upper limit to Jmax values for fitting. Defaults to 100,000 $\mu\text{mol m}^{-2} \text{s}^{-1}$ as this is the "nonsense output" from fitaci. Ensures that these points are not fit.
limit_vcmax	Upper limit to Vcmax values for fitting. Defaults to 100,000 $\mu\text{mol m}^{-2} \text{s}^{-1}$ .
...	Arguments to be passed on to minpack.lm::nlsLM(). See ?nlsLM for details.

### Value

fit\_topt\_VJ fits the Topt modified Arrhenius function to Vcmax and Jmax data. Note that Hd may max out at 3000 kJ mol<sup>-1</sup> for Jmax and 2000 kJ mol<sup>-1</sup> for Vcmax. REFERENCE Medlyn BE, Dreyer E, Ellsworth D, Forstreuter M, Harley PC, Kirschbaum MUF, Le Roux X, Montpied P, Strassemeier J, Walcroft A, Wang K, Loutstau D. 2002. Temperature response of parameters of a biochemically based model of photosynthesis. II. A review of experimental data. Plant Cell Environ 25:1167-1179

### Examples

```
#Read in data
data <- read.csv(system.file("extdata", "example_1.csv",
package = "plantecowrap"), stringsAsFactors = FALSE)
#Fit ACi Curves then fit temperature responses
fits <- fitacis2(data = data,
  varnames = list(ALEAF = "A",
    Tleaf = "Tleaf",
    Ci = "Ci",
    PPFD = "PPFD",
    Rd = "Rd",
    Press = "Press"),
  group1 = "Treat",
  fitTPU = FALSE,
  fitmethod = "bilinear",
  gm25 = 10000,
  Egm = 0)
#Extract coefficients
outputs <- acisummary(data, group1 = "Treat", fits = fits)
#Fit temperature response
tresp <- fit_topt_VJ(outputs)
#View plot
tresp[[3]]
```

---

 fit\_topt\_VJs

*Fitting multiple temperature response curves*

---

### Description

Fitting multiple temperature response curves

**Usage**

```
fit_topt_VJs(
  data,
  group,
  varnames = list(Vcmax = "Vcmax", Jmax = "Jmax", Tleaf = "Tleaf"),
  limit_jmax = 1e+05,
  limit_vcmax = 1e+05,
  ...
)
```

**Arguments**

<code>data</code>	Dataframe with multiple temperature response curves for Vcmax (maximum rubisco carboxylation capacity in $\mu\text{mol m}^{-2} \text{s}^{-1}$ ) and Jmax (maximum photosynthetic electron transport to CO <sub>2</sub> fixation in $\mu\text{mol m}^{-2} \text{s}^{-1}$ ).
<code>group</code>	Grouping variable to use, e.g. Plant ID
<code>varnames</code>	Variable names. Reassigns variable names to account for different spellings of Vcmax, Jmax, and Tleaf
<code>limit_jmax</code>	Upper limit to Jmax values for fitting. Defaults to 100,000 $\mu\text{mol m}^{-2} \text{s}^{-1}$ as this is the "nonsense output" from fitaci. Ensures that these points are not fit.
<code>limit_vcmax</code>	Upper limit to Vcmax values for fitting. Defaults to 100,000 $\mu\text{mol m}^{-2} \text{s}^{-1}$ .
<code>...</code>	Arguments to be passed on to <code>minpack.lm::nlsLM</code> via <code>fit_topt_VJ()</code> . See <code>?nlsLM</code> for details.

**Value**

`fit_topt_VJs` fits multiple Vcmax and Jmax temperature responses using the optimum temperature response model from Medlyn et al. 2002. REFERENCE Medlyn BE, Dreyer E, Ellsworth D, Forstreuter M, Harley PC, Kirschbaum MUF, Le Roux X, Montpied P, Strassmeyer J, Walcroft A, Wang K, Loutstau D. 2002. Temperature response of parameters of a biochemically based model of photosynthesis. II. A review of experimental data. *Plant Cell Environ* 25:1167-1179

**Examples**

```
#Read in data
data <- read.csv(system.file("extdata", "example_2.csv",
  package = "plantecowrap"), stringsAsFactors = FALSE)
#Fit ACi Curves then fit temperature responses
fits <- fitacis2(data = data,
  varnames = list(ALEAF = "A",
    Tleaf = "Tleaf",
    Ci = "Ci",
    PPFd = "PPFD",
    Rd = "Rd",
    Press = "Press"),
  group1 = "Grouping",
  fitTPU = FALSE,
  fitmethod = "bilinear",
```

```

        gm25 = 10000,
        Egm = 0)
#Extract coefficients
outputs <- acisummary(data, group1 = "Grouping", fits = fits)
#Plot curve fits
for (i in 1:length(fits)) {
  plot(fits[[i]])
}
#Separate out grouping variable
outputs <- separate(outputs, col = "ID", c("Treat", "Block"), sep = "_")
#Fit the Topt model from Medlyn et al. 2002 for all individuals
#Output is a list of lists for each individual
#There is also a fit_topt_VJ for single temperature response
#fitting
out <- fit_topt_VJs(data = outputs,
                    group = "Block", #this grouping variable is for
                    #each individual
                    varnames = list(Vcmax = "Vcmax",
                                     Jmax = "Jmax",
                                     Tleaf = "Tleaf"),
                    limit_jmax = 100000,
                    limit_vcmax = 100000)
#Let's get the parameters out into a single data frame
pars <- get_t_pars(out)
#Let's get the graphs out into a list
#You can get a graph using: graph[1]
graphs <- get_t_graphs(out)

```

---

get\_t\_graphs

*Get temperature response graphs*

---

### Description

Get temperature response graphs

### Usage

```
get_t_graphs(data)
```

### Arguments

data                    List of data output from fit\_topt\_VJs

### Value

get\_t\_graphs returns temperature response graphs for Vcmax and Jmax from the group fitting process. Output is a list of graphs.

## Examples

```

#Read in data
data <- read.csv(system.file("extdata", "example_2.csv",
package = "plantecowrap"), stringsAsFactors = FALSE)
#Fit ACi Curves then fit temperature responses
fits <- fitacis2(data = data,
                 varnames = list(ALEAF = "A",
                                Tleaf = "Tleaf",
                                Ci = "Ci",
                                PPFd = "PPFD",
                                Rd = "Rd",
                                Press = "Press"),
                 group1 = "Grouping",
                 fitTPU = FALSE,
                 fitmethod = "bilinear",
                 gm25 = 10000,
                 Egm = 0)
#Extract coefficients
outputs <- acisummary(data, group1 = "Grouping", fits = fits)
#Plot curve fits
for (i in 1:length(fits)) {
  plot(fits[[i]])
}
#Separate out grouping variable
outputs <- separate(outputs, col = "ID", c("Treat", "Block"), sep = "_")
#Fit the Topt model from Medlyn et al. 2002 for all individuals
#Output is a list of lists for each individual
#There is also a fit_topt_VJ for single temperature response
#fitting
out <- fit_topt_VJs(data = outputs,
                   group = "Block", #this grouping variable is for
                   #each individual
                   varnames = list(Vcmax = "Vcmax",
                                    Jmax = "Jmax",
                                    Tleaf = "Tleaf"),
                   limit_jmax = 100000,
                   limit_vcmax = 100000)
#Let's get the graphs out into a list
#You can get a graph using: graph[1]
graphs <- get_t_graphs(out)

```

---

get\_t\_pars

*Get temperature response parameters*

---

## Description

Get temperature response parameters

**Usage**

```
get_t_pars(data)
```

**Arguments**

data                   List of data output from fit\_topt\_VJs

**Value**

get\_t\_pars returns temperature response parameters for Vcmax and Jmax from the group fitting process. Output is a dataframe.

**Examples**

```
#Read in data
data <- read.csv(system.file("extdata", "example_2.csv",
package = "plantecowrap"), stringsAsFactors = FALSE)
#Fit ACi Curves then fit temperature responses
fits <- fitacis2(data = data,
                 varnames = list(ALEAF = "A",
                                Tleaf = "Tleaf",
                                Ci = "Ci",
                                PPFd = "PPFD",
                                Rd = "Rd",
                                Press = "Press"),
                 group1 = "Grouping",
                 fitTPU = FALSE,
                 fitmethod = "bilinear",
                 gm25 = 10000,
                 Egm = 0)
#Extract coefficients

pars <- get_t_pars(out)
```

---

modarrhenius	<i>Fitting the peaked Arrhenius temperature response model</i>
--------------	--

---

**Description**

Fitting the peaked Arrhenius temperature response model

**Usage**

```
modarrhenius(Ea, Hd, dS, Tleaf)
```

**Arguments**

Ea	activation energy in kJ mol <sup>-1</sup>
Hd	deactivation energy in kJ mol <sup>-1</sup>
dS	entropy of deactivation in kJ mol <sup>-1</sup>
Tleaf	leaf temperature in Celsius

**Value**

modarrhenius is used to fit a peaked Arrhenius model. REFERENCE Medlyn BE, Dreyer E, Ellsworth D, Forstreuter M, Harley PC, Kirschbaum MUF, Le Roux X, Montpied P, Strassmeyer J, Walcroft A, Wang K, Loutstau D. 2002. Temperature response of parameters of a biochemically based model of photosynthesis. II. A review of experimental data. Plant Cell Environ 25:1167-1179

---

print_graphs	<i>Printing graphs from a list of graphs</i>
--------------	--

---

**Description**

Printing graphs from a list of graphs

**Usage**

```
print_graphs(data, path, height = 5, width = 5, res = 600, units = "in", ...)
```

**Arguments**

data	List of graphs to output as .jpeg files
path	File path for printing out graphs. Use "." to set to current working directory.
height	Height of output graphs. Defaults to 5.
width	Width of output graphs. Defaults to 5.
res	Resolution of output graphs. Defaults to 600.
units	Units of height and width. Defaults to "in".
...	Further arguments, specifically for jpeg().

**Value**

print\_graphs creates jpeg files from a list of graphs based on the graph names. Used in combination with get\_t\_graphs. Output is a series of .jpeg files in the working directory.

**Examples**

```
#Read in data
data <- read.csv(system.file("extdata", "example_2.csv",
package = "plantecowrap"), stringsAsFactors = FALSE)
#Fit ACi Curves then fit temperature responses
fits <- fitacis2(data = data,
  varnames = list(ALEAF = "A",
    Tleaf = "Tleaf",
    Ci = "Ci",
    PPFd = "PPFD",
    Rd = "Rd",
    Press = "Press"),
  group1 = "Grouping",
  fitTPU = FALSE,
  fitmethod = "bilinear",
  gm25 = 10000,
  Egm = 0)
#Extract coefficients
outputs <- acisummary(data, group1 = "Grouping", fits = fits)
#Plot curve fits
for (i in 1:length(fits)) {
  plot(fits[[i]])
}
#Separate out grouping variable
outputs <- separate(outputs, col = "ID", c("Treat", "Block"), sep = "_")

`toptfit`*Fitting the Topt temperature response model*

---

**Description**

Fitting the Topt temperature response model

**Usage**

```
toptfit(Ea, Hd, kopt, Tleaf, Topt)
```

**Arguments**

Ea	activation energy in kJ mol <sup>-1</sup>
Hd	deactivation energy in kJ mol <sup>-1</sup>
kopt	parameter value at optimum temperature
Tleaf	leaf temperature in Celsius
Topt	optimum leaf temperature in Celsius

**Value**

toptfit is the Topt temperature response model. REFERENCE Medlyn BE, Dreyer E, Ellsworth D, Forstreuter M, Harley PC, Kirschbaum MUF, Le Roux X, Montpied P, Strassmeyer J, Walcroft A, Wang K, Loutstau D. 2002. Temperature response of parameters of a biochemically based model of photosynthesis. II. A review of experimental data. *Plant Cell Environ* 25:1167-1179
